

Samurai Heater Box / Cowl Vent

Aqualu provides the option to cut the cowl vent slats and heater drain holes on the Samurai #6000 SWB, #6010 LWB or #6020 13" stretch custom cab.

These vent slots and heater hose pass-through holes can be eliminated to keep debris from falling into the heater box. With the vent holes removed, the heater re-circulates cabin air rather than pulling fresh air into the cabin.

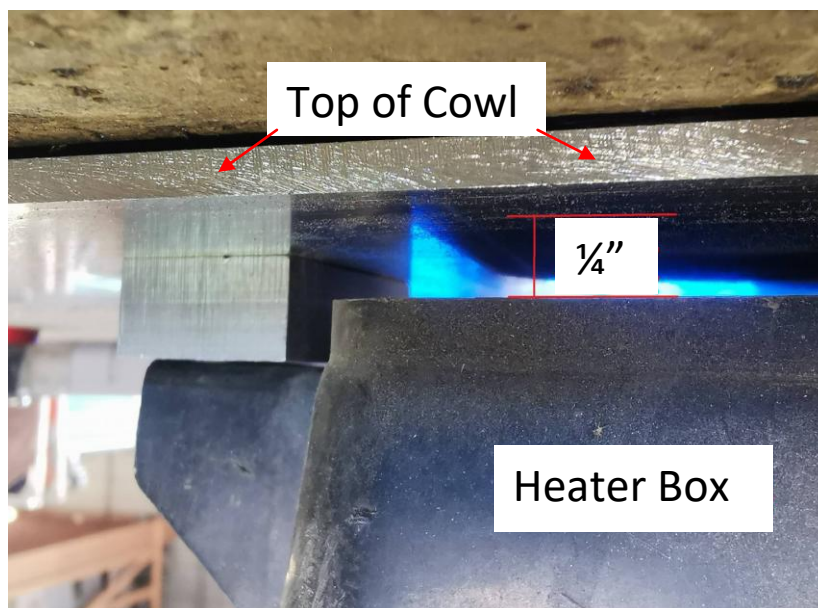

The following outlines what airbox modifications need to be made to install the heater box when vent holes are not cut:

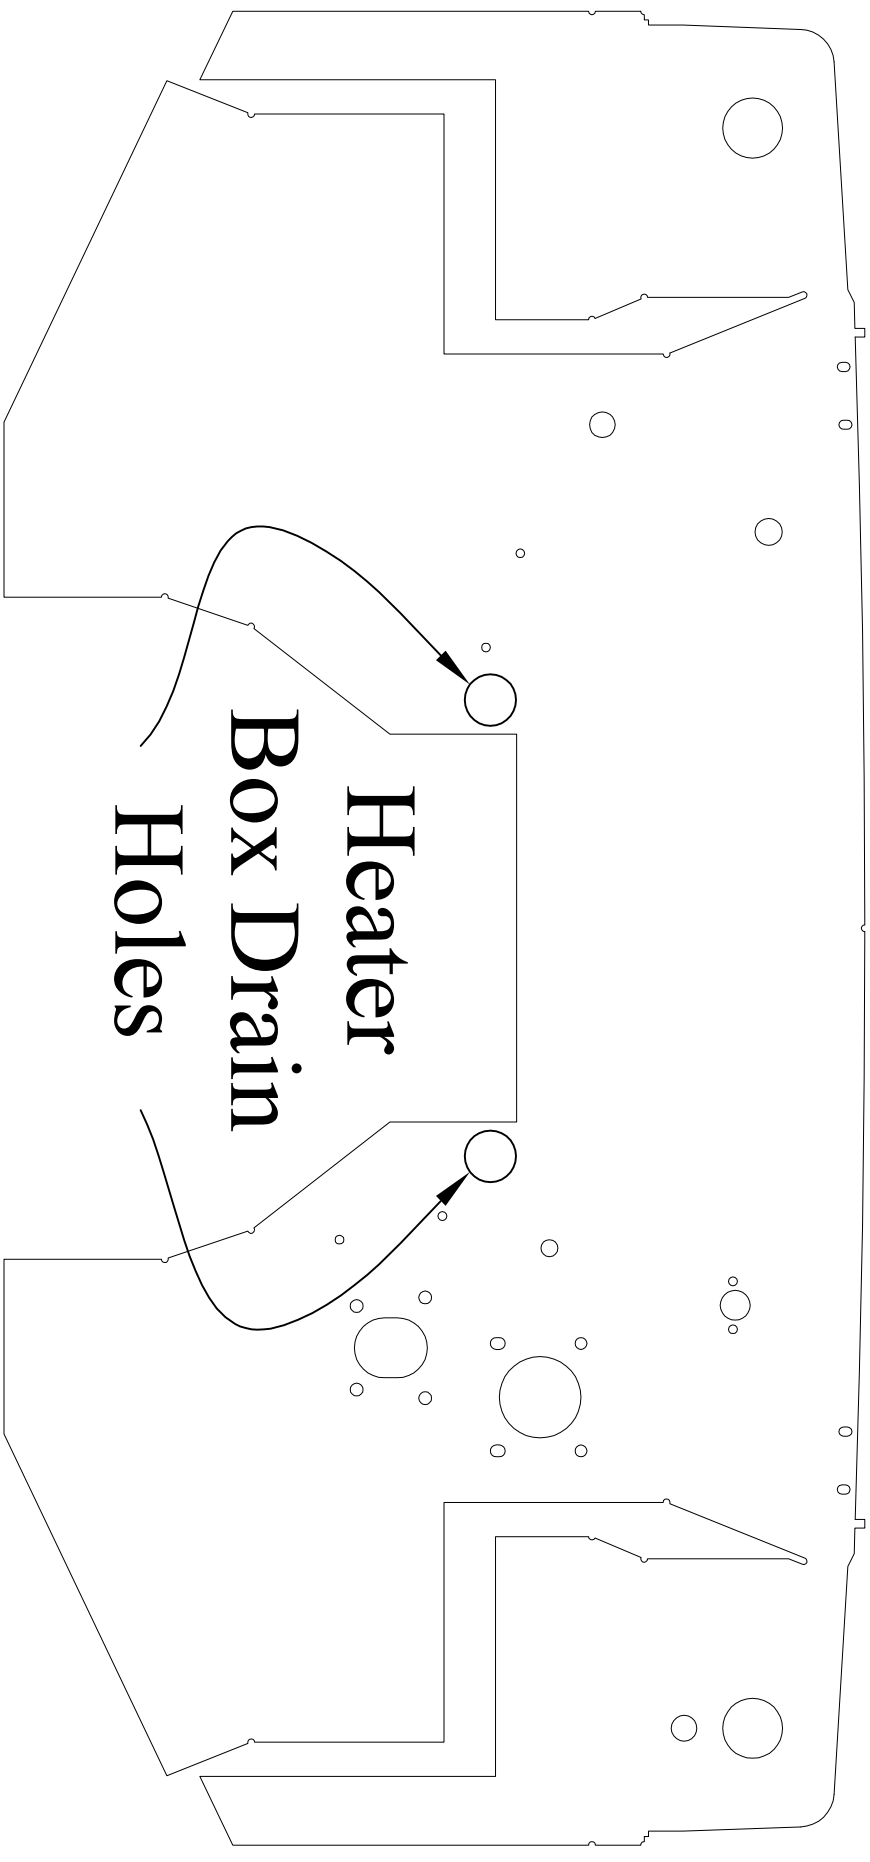

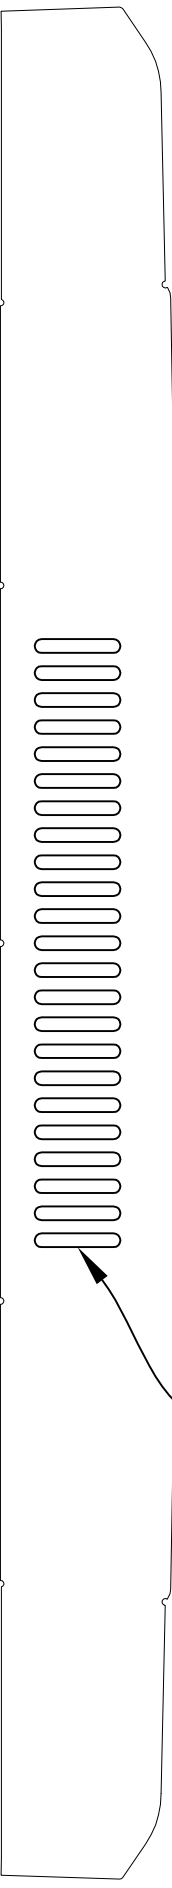

Heater box gasket must be removed (highlighted in red below)

This creates a gap approximately 1/4" tall, allowing passenger cabin air to enter the heater box before re-circulating to the outlets.
